

Day 4 — CSS: Recap & Task

MODULE 01 • CLASS SUMMARY + TAKE-HOME ASSIGNMENT

A record of today's CSS session and the task to complete before the next class. Read the whole brief before you start.

1 What we covered today

- **Why CSS matters** — HTML gives a page its structure; CSS gives it its look.
- **Where you put CSS, and why it affects performance** (see the painter analogy below).
- **Selectors** — element, class, id, grouping, and the rest.
- How CSS finds elements through the **DOM**, and how to inspect it in **Developer Tools** — the Elements tab and the Styles panel.
- Writing CSS **live, directly in the browser**.
- The **three ways to add CSS**: inline (on the tag), internal (a style block in the same file), and external (a separate .css file — the one you should actually use).
- **File paths**, like using ./ to link your CSS correctly.

***The painter analogy:** Think of a painter. If the painter colours the house **as it's being built** (CSS in the <head>), you only ever see the finished, painted house. If the painter shows up **after the house is fully built** (CSS at the bottom), you see the plain grey house first, then watch it get painted. That flash of unstyled page is the difference — which is why CSS usually goes in the <head>.*

2 Your task

1. **Style your resume.** Go back to your resume page and style it using everything we covered today.
2. **Write your learnings.** Inside your resume repo, make a folder called learnings and add a file css.md. Write what we learnt today in your own words — your understanding, not copied notes.
3. **Build three small practice projects** (see the reference image for what to aim for):
 - **A profile card** — photo, name, short bio, and a button.
 - **A navigation bar** — a horizontal menu with hover effects.
 - **A button collection** — a few different styles with hover states.

3 Keep it in ONE repo, organized in folders

```
resume/  
index.html  
style.css  
learnings/  
css.md  
projects/  
profile-card/  
navbar/  
buttons/
```

4 How to submit (use git from the terminal, not the website)

```
git add .  
git commit -m "added css styling, learnings and 3 projects"  
git push origin main
```

Then share your repo link in the group.

★ Reference: what the 3 projects should look like

The 3 CSS practice projects — what to aim for

Rough targets, not exact. Make them your own.

1 • Profile card

2 • Navigation bar

3 • Button collection

Rough targets, not exact. Make them your own.
