

Day 3 — Class Summary & Take-home Task

HTML5 DEEP DIVE • MODULE 01 • CLASS MINUTES + ASSIGNMENT

A quick record of what we covered today and the task to complete before the next session. Read the whole brief before you start — the tag requirements are strict on purpose.

1 What we covered today

- HTML is a **markup language**, not a programming language — it describes meaning and structure, not logic.
- Anatomy of an element: opening tag, attribute, value, content, closing tag; plus self-closing tags like `<img>` and `<br>`.
- The document skeleton: `<!DOCTYPE html>`, `<head>` (for the machine) vs `<body>` (for the human).
- **Semantic HTML** — the day's big idea: tags that name the role of content (header, nav, main, article, section, footer) instead of `<div>` soup.
- The everyday tag toolkit: headings, paragraphs, lists, links, images, tables.
- Forms & inputs, and how they connect back to the HTTP GET / POST we saw on Day 2.
- How the browser parses HTML into the DOM tree: bytes → tokenize → build the DOM.
- Good vs bad habits: semantic-first, alt text on images, logical heading order, style stays in CSS.

2 Reference material

Day 2 recap — how a website opens in the browser (sample repo):

```
github.com/DineshCodeFlow/how-a-website-opens-in-the-browser
```

Useful docs for the task: MDN HTML element reference

(developer.mozilla.org/en-US/docs/Web/HTML/Element) and the MDN semantic-HTML guide. Keep these open while you build.

3 Take-home task: build your resume in pure HTML

Build your own personal resume as a single HTML page — **HTML only, no CSS yet** (we style it on Day 4). The goal is to prove you can structure a real page with the correct semantic tags.

Sections your page must include:

- **Header** with your name and a photo
- **About me**
- **Education**
- **Skills**
- **Projects**
- **Hobbies**
- **Contact information**
- **Footer**

4 Requirements

- Use **semantic tags** throughout — they describe the role of each region.

- Include at least **one list** (e.g. your skills or hobbies).
- Use **clickable links** (anchor tags).
- Include **external links** to your LinkedIn and GitHub profiles.
- **Avoid <div> and completely** — if you reach for one, find the right semantic tag instead.

5 Mandatory tags (use every one of these)

```
header footer nav aside section article hgroup
ul ol li table details summary figcaption
img form input button
```

Note: your list said “ui” — that is corrected to **ul** (unordered list). A few of these stretch beyond basic resumes on purpose: use **figure + figcaption** for your photo, **details + summary** for an expandable section (e.g. a project's detail), **hgroup** to group a heading with its tagline, and a **table** for something genuinely tabular like your education timeline. **nav** can link between your own sections.

6 How to submit

- Create a **new Git repository** named **resume**.
- Add your HTML file (e.g. `index.html`) to it.
- Commit and **push** it to GitHub under your own account.
- Bring your repo link to the next session.

The commands you'll use:

```
git init
git add index.html
git commit -m "my html resume"
git branch -M main
git remote add origin <your-repo-url>
git push -u origin main
```

★ The only rule

```
zero <div> and zero <span> tags
```

If your page works with only semantic tags, you have understood today's lesson. Tomorrow we add CSS and make it look like a real site.
